Plant fiber pulp refers to cellulose pulp extracted from plant-based raw materials, such as wood, bamboo, crop residues, and other plant fibers, used in the production of paper, paper products, packaging materials, textile fibers, and other industrial applications. Depending on the source and processing method, it can be categorized into wood pulp, non-wood pulp, dissolving pulp, and recycled fiber pulp. It is renewable, biodegradable, and plays a key role in sustainable and environmentally friendly packaging solutions. In 2024, global plant fiber pulp sales reached 84.8 million tons, with an average selling price of USD 690/ton; the industry's average gross profit margin was approximately 20–25%, and the capacity of a single production line was typically 50,000–100,000 tons/year. Plant fiber pulp is a cellulose pulp produced from wood, bamboo, crop residues, and other plant fibers using chemical or mechanical processing. The upstream sector includes forestry harvesting, crop collection, and raw material transport; the midstream focuses on pulp production, including wood pulp, non-wood pulp, dissolving pulp, and recycled pulp; while the downstream applications cover paper and paper products, packaging materials, textile fibers, and specialty industrial uses such as filter paper and absorbent materials. Plant fiber pulp is renewable and biodegradable, serving as a key raw material for sustainable packaging and environmentally friendly fiber industries.
