Abstracts

The global Plant Lodging Resistance Meter market size is predicted to grow from US$ 12.93 million in 2025 to US$ 21.79 million in 2032; it is expected to grow at a CAGR of 7.9% from 2026 to 2032.

In 2024, global production of Plant Lodging Resistance Meter reached approximately 9,600 units, with an average selling price of approximately US$1,280 per unit. The annual production capacity of a single production line is approximately 500 units, with an average gross profit margin of approximately 30-40%. Plant Lodging Resistance Meter is used to measure the stem strength, bending resistance, compressive strength, and puncture strength of plants (especially crops) to assess their lodging resistance. By measuring live stems during the plant's growth stage, the instrument provides important evidence for crop genetic breeding, variety screening, cultivation optimization, and agricultural research, helping to identify varieties with superior lodging resistance, thereby increasing yields and reducing losses from mechanical harvesting.

The upstream supply chain primarily includes suppliers of core components, basic software, and raw materials. These include hardware manufacturers providing precision force sensors, data acquisition modules, mechanical components, and chips; software vendors developing embedded systems and data analysis algorithms; and material companies supplying raw materials such as metals and plastics. The downstream application end covers agricultural research and breeding institutions, seed companies, agricultural extension departments, and large farms pursuing refined production. They use the instrument to evaluate crop lodging resistance, screen varieties, and provide cultivation technology guidance.
