## Abstracts

The global Plant Vaccine market size is predicted to grow from US\$ million in 2025 to US\$ million in 2031; it is expected to grow at a CAGR of % from 2025 to 2031.

Plant vaccines, also known as plant-based vaccines, are a type of biotechnology that involves using plants to produce vaccines against various diseases. This approach is different from traditional methods of producing vaccines, which typically involve growing microbes or animal cells in culture. Plant vaccines work by introducing a gene encoding a specific part of a pathogen's antigen, such as a protein, into the plant's genome. As the plant grows, it produces the antigen, which triggers an immune response in the human or animal host that consumes it. This immune response is similar to the response that occurs when a traditional vaccine is administered.

United States market for Plant Vaccine is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
