Plasmon resonance instrument is a highly sensitive biochemical analysis device based on the principle of surface plasmon resonance or localized surface plasmon resonance, which can realize label-free and real-time monitoring of the dynamic process of molecular interactions. The instrument uses the plasma resonance signal excited by the metal (usually gold or silver) surface to detect the refractive index change caused by molecular binding events. It is widely used in drug screening, protein interaction, antibody affinity assessment, biosensor and disease marker research.
