The global Plasma Sprayed Titanium Powder market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Plasma sprayed titanium powder is a type of coating material that is produced by melting and spraying tiny particles of titanium onto a surface using a plasma torch. The process involves heating the titanium powder to a high temperature, which causes it to melt and form tiny droplets. These droplets are then propelled onto the surface to be coated using a stream of gas, where they solidify and form a thin layer of titanium coating.

This type of coating is commonly used in a variety of industrial applications, including aerospace, automotive, and biomedical industries, due to its excellent corrosion resistance, biocompatibility, and high strength-to-weight ratio. It is also used in the production of prosthetic implants, where it can be used to coat the surface of the implant to improve its biocompatibility and reduce the risk of rejection by the body.

United States market for Plasma Sprayed Titanium Powder is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
