The plasma sterilization indicator card is a specialized tool used to monitor the effectiveness of low-temperature plasma sterilization. Plasma sterilization is a technology that uses low-temperature plasma for sterilization, commonly used for sterilizing medical devices and items that are not resistant to high temperatures and humidity. The indicator card is coated with indicators that are sensitive to specific chemical substances (such as hydrogen peroxide decomposition products) or physical factors (such as ultraviolet radiation, reactive oxygen species, etc.) generated during the plasma sterilization process. In the process of plasma sterilization, when the specified sterilization parameters are reached, the indicator on the indicator card will change color or other observable changes to determine whether the item has undergone effective plasma sterilization, providing important basis for sterilization quality control.
