The global Plastic Body pH Electrode market size is predicted to grow from US$ 597 million in 2025 to US$ 817 million in 2032; it is expected to grow at a CAGR of 4.7% from 2026 to 2032.

In 2024, global production of Plastic Body pH Electrode reached approximately 7.3 million units, with an average selling price of approximately US$80 per unit. Single-line production capacity is approximately 180,000 units per year, with an average gross profit margin of approximately 40-50%. Plastic Body pH Electrode is a composite pH electrode with a plastic shell (such as polycarbonate). It is impact-resistant and non-breakable, suitable for use in non-high-temperature, non-corrosive environments ranging from 0-80°C. It is commonly used in water treatment, chemical, and food processing, and can also be used to measure surface or semi-solid samples. Its internal structure combines a pH glass indicator electrode with a reference electrode and uses gel KCl as a reference solution, simplifying operation and maintenance.

The upstream supply chain for Plastic Body pH Electrode includes suppliers of core raw materials such as specialty glass, precious metals, engineering plastics, reference electrolytes, and ceramics/Teflon. Downstream, its applications are directly addressed in environmental monitoring, industrial production (chemical, pharmaceutical, and food and beverage process control), aquaculture, laboratory testing, and education.

United States market for Plastic Body pH Electrode is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Plastic Body pH Electrode is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
