A plastic circular loom is an industrial machine used to produce plastic woven bags or other types of plastic woven products. This kind of machine weaves plastic flat wire or film into the desired product in a circular pattern and is often used to manufacture packaging bags of various capacities, such as fertilizer bags, chemical product bags, flour bags, etc. During operation, the plastic circular loom melts thermoplastics through heating and then extrudes them into films or flat filaments. After these flat yarns are cooled, they are pulled through the knitting needles on the circular loom and woven into a cylindrical product according to a specific pattern. These cylinders can then be cut, heat-sealed or further processed into flat bags, folding bags or other forms of packaged products. Plastic woven bags are widely used in many industries because of their durability, high tensile strength, corrosion resistance, and low cost. The plastic circular loom is the key equipment in this production process. It meets the large demand for plastic weaving products in the market through high efficiency and automation.

The global Plastic Circular Loom market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of %from 2024 to 2030.
