Plastic optical fiber for endoscopes is a flexible optical fiber material used for endoscope lighting and image transmission. It is made of polymer materials and has good bendability and fracture resistance. This optical fiber is often used in disposable medical devices because it is economical and easy to process, and can adapt to various bending angles without affecting the quality of light transmission. Plastic optical fiber for endoscopes is mainly used in the light guide system of endoscopes to transmit light from the light source to the field of view, ensuring the lighting effect of the endoscope in a small space, and can also transmit image information. Compared with traditional glass optical fibers, plastic optical fibers have the characteristics of high flexibility, light weight, and strong impact resistance, but their high temperature resistance and short transmission distance are suitable for short-distance, low-cost medical applications. Therefore, the application of plastic optical fibers in modern disposable endoscope instruments has gradually increased, and it has become more and more popular with medical device manufacturers.
