Plastic surgery instrument sterilization box is a device used to sterilize and clean plastic surgery instruments. These instruments may include various scalpels, tweezers, needles, scissors, and other tools that are frequently used in plastic surgery procedures.

Sterilization boxes are usually made of materials that are resistant to high temperatures and chemical disinfectants to ensure that bacteria and viruses can be effectively eliminated during high temperature and chemical disinfection processes. Sterilization boxes usually have sealing properties to ensure the integrity and sterility of the instruments during the sterilization process.

The use of plastic instrument sterilization boxes helps ensure that the instruments used in plastic surgery meet strict sterility requirements, reduce the risk of surgical infection, and improve the safety and success rate of surgery. These sterilization boxes are usually designed in different sizes and shapes according to the size and shape of the instruments to accommodate different types of instruments and ensure that they are fully exposed to the disinfectant during the sterilization process.
