Metal plating (also known as electroplating or electrodeposition) is a coating technology that deposits a thin layer of a metal or alloy on a conductive surface to impart particular functional or aesthetic properties. During the plating process, the object to be plated functions as the positively charged cathode while the desired plating material serves as the negatively charged anode and source of the metallic ions that will form the final coating. Immersing both materials in a bath or solution of electrolyte salts and adding an electrical current causes an oxidation/reduction reaction on the surface of the cathode where the metallic ions are deposited.

There are numerous metals commonly used as plating materials such as zinc, copper,

chromium, and nickel. which impart wear and corrosion resistance, improve strength, and enhance solderability. Precious metal coatings are especially important to the electronics and semiconductor industries.

In the Chinese market, The major manufacturers are Dow, Mitsubishi Materials, Corporation, Heraeus, Xilong Science, AtoTech, Yamato Denki, Meltex, Ishihara Chemical, Raschig GmbH, Japan Pure Chemical, Coatech, Magneto Special Anedes, Vopelius Chemie AG, Moses Lake Industries and JCU International, etc.
