Resistance thermometers, also called resistance temperature detectors (RTDs), are sensors used to measure temperature. Many RTD elements consist of a length of fine wire wrapped around a ceramic or glass core but other constructions are also used. The RTD wire is a pure material, typically platinum, nickel, or copper. The material has an accurate resistance/temperature relationship which is used to provide an indication of temperature. As RTD elements are fragile, they are often housed in protective probes.

This report focus on Platinum Temperature Sensors market.

Platinum as a Temperature Sensor A platinum RTD element is a thermal resistor — a resistor with a value that changes by a predictable amount in response to temperature changes. Platinum RTD elements have a positive temperature coefficient (PTC), meaning the resistance increases with increasing temperature. A virtually linear change in resistance, coupled with intrinsic chemical and temperature resistance, makes platinum an ideal base material for temperature sensing.
