The global Pneumatic Shock Absorber market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

The structural feature of the pneumatic shock absorber is that a floating piston is installed at the lower part of the cylinder, and a closed air chamber formed by the floating piston and one end of the cylinder is filled with high-pressure nitrogen. A large-section O-ring is installed on the floating piston, which completely separates oil and gas. The working piston is equipped with a compression valve and an expansion valve that change the cross-sectional area of the channel with the speed of its movement. The pneumatic shock absorber is an advanced shock absorber that uses gas compression to achieve shock absorption. Compared with the hydraulic shock absorber, the pneumatic shock absorber has greatly improved the shock absorption effect, control performance and comfort.

United States market for Pneumatic Shock Absorber is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
