The global PNP Darlington Bipolar Transistor market size is predicted to grow from US$ million in 2025 to US$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

A PNP Darlington bipolar transistor is a special type of transistor that belongs to the category of bipolar (bipolar) transistors. It is composed of two PNP transistors coupled with each other through their collectors and emitters, forming a cascaded amplification structure to achieve higher amplification and greater output current capability. A PNP Darlington bipolar transistor typically includes three electrodes: base (B), emitter (E1) and collector (E2). Wherein, the emitter E1 is connected to the base B of the PNP transistor, and the collector E2 is connected to the emitter E1 of the PNP transistor, thereby forming a cascaded amplification structure. Features of PNP Darlington bipolar transistors include:

1. High magnification: Due to the cascaded amplification structure, the PNP Darlington bipolar transistor usually has a high current magnification (? value), which can amplify the input signal to a larger output signal.

2. Large output current capability: The output current capability of PNP Darlington bipolar transistor is relatively large, which is suitable for applications that require large output current.

3. Low input and output impedance: PNP Darlington bipolar transistor has relatively low input and output impedance, which is good for matching and driving other circuits.

4. Wide range of applications: PNP Darlington bipolar transistors are widely used in
