## Abstracts

The report requires updating with new data and is sent in 48 hours after order is placed.

Polarization Image Sensor is a sensor that captures the direction of vibration of light waves, i.e. polarization information, which is not directly perceived by the human eye. This sensor detects changes in the direction of vibration when light strikes the surface of an object, thereby enabling functions such as object shape recognition and elimination of interference from reflected light. Polarization image sensors capture the direction of vibration of light waves and, unlike conventional image sensors, provide additional polarization information, which helps to achieve more accurate detection and analysis.

The global Polarization Image Sensor market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
