A polarization test piece is a test tool used to detect the state of polarization in an optical system. It is usually made of a piece of material with special optical properties, such as polarizing glass or polarizing film. Polarization test pieces can test the performance of optical systems by changing the polarization state of light, such as detecting the working status and performance of polarizers, polarization beam splitters, polarization rotators and other components. Common polarizers include linear polarizers and circular polarizers. Linear polarizers can convert unpolarized light into

linearly polarized light and detect the polarization direction of linearly polarized light; circular polarizers can convert linearly polarized light into circularly polarized light and detect the rotation direction of circularly polarized light. Polarization test coupons play an important role in the design, manufacture and maintenance of optical systems.
