## Abstracts

The global Polarizer Protective Film market size is predicted to grow from US\$ 1718 million in 2025 to US\$ 2385 million in 2032; it is expected to grow at a CAGR of 4.9% from 2026 to 2032.

Polarizing protective film is an optical protective film with high cleanliness, high transmittance, no residue during peeling, anti-static, dustproof, anti fouling, low migration, and extremely narrow peeling force control range and low climb. It is mainly used in the production and transportation of polarizing films, the assembly and final use of display modules, to protect display materials from external damage during long-term supply chain turnover, improve component yield and output efficiency, and is an important raw material in the display panel industry.

The polarizer protective film is directly attached to the TAC film in the polarizer. The TAC film usually undergoes one or more complex surface treatments such as anti glare, low reflection, transparent hardening, and low reflection, which requires the polarizer protective film to have good compatibility. Meanwhile, the polarizer protective film also serves to isolate external moisture, specific radiation, and other external substances from damage,

Capable of withstanding a certain degree of external impact, thereby ensuring that the internal optical film remains in a stable operating environment throughout the turnover process. Secondly, the optical properties of polarizer protective films directly affect the performance and yield of display panels from production to distribution to end consumers. The preparation, synthesis, coating, and final mass production of corresponding materials must meet the delivery requirements of optical grade products. In 2025, global Polarizer Protective Film production reached approximately 934 M Sqm,

with an average global market price of around US\$ 1.88 per Sqm.

In recent years, the polarizer protective film market has maintained steady growth, mainly driven by the expansion of the global display panel industry and the sustained growth in demand for end consumer electronics products. With the development of LCD displays, car displays, and large-size TV markets, the production of polarizing films continues to increase, thereby driving the synchronous growth of demand for protective films. At the same time, the manufacturing process of display panels continues to upgrade, placing higher demands on the cleanliness, stable adhesion performance, and anti-static ability of protective films. High performance micro adhesive protective films and functional protective films are gradually becoming the mainstream in the market. In the future, with the development of high-resolution displays, in car intelligent cockpits, and new display technologies, the polarizer protective film industry will move towards high quality, high stability, and customization, and market concentration is expected to further increase.
