The global Polishing Mixed Bed Resin for UPW market size is predicted to grow from US\$ 636 million in 2025 to US\$ 1330 million in 2032; it is expected to grow at a CAGR of 11.2% from 2026 to 2032.

Electronic-grade ultrapure water polishing mixed bed resin is a high-purity mixed ion exchange material specially developed for the terminal purification of ultrapure water in the electronic manufacturing industry. Composed of precisely proportioned high-purity strong acid cation resin and strong base anion resin, it features extremely low impurity dissolution and efficient ion removal performance. It can deeply eliminate trace residual ions, organic substances and fine pollutants in water, stably produce high-standard ultrapure water, and is widely used in semiconductors, photovoltaics and precision electronics fields, serving as a core functional material to meet the ultra-high water quality requirements of high-end electronic production. In 2025, the global market for electronic-grade UPW polishing mixed bed resin is valued at around USD 650 million.

According to our research, the Electronic Grade Ultrapure Water Polishing Mixed Bed Resin industry is entering a critical transition phase from conventional industrial water treatment materials toward semiconductor-grade ultra-high-purity purification materials. The primary growth drivers are the rapid expansion of advanced semiconductor manufacturing, advanced packaging facilities, flat panel display production, and high-end electronics manufacturing capacity. From the demand perspective, advanced process nodes below 7nm, HBM packaging technologies, third-generation semiconductors, and high-purity electronic chemical production are continuously increasing requirements for ultrapure water stability and contamination control, significantly accelerating demand for low-TOC, low-boron-leaching, and ultra-low-metal-contamination mixed bed resins. Continuous global semiconductor capital expenditure

growth and concentrated fab construction activities across Asia are simultaneously driving investment in ultrapure water systems, creating a stable long-term demand cycle for polishing mixed bed resins. From the product technology perspective, uniform particle size distribution, high exchange kinetics, extended operational lifetime, and cleanroom-grade packaging have become mainstream development directions. Some premium products are increasingly emphasizing online operational stability and ultra-long service intervals to reduce semiconductor plant downtime and replacement costs. In terms of regional supply chains, Japan, the United States, and Europe continue to maintain advantages in high-end purification technologies and core resin formulation capabilities, while Mainland China, Taiwan, and South Korea are accelerating localized supply chain development and domestic substitution of mid- to high-end electronic-grade resins. The competitive landscape demonstrates a clear two-tier structure, where the premium market is concentrated among suppliers with advanced ultrapure purification capabilities, semiconductor qualification systems, and long-term stable supply capacity, while the broader supplier ecosystem also includes industrial ion exchange resin manufacturers, nuclear-grade resin suppliers, and general ultrapure water material companies. Recent capital expenditure activities have mainly focused on clean manufacturing lines, ultra-low metal contamination control systems, and electronic-grade post-treatment facilities. Supported by semiconductor supply chain regionalization and increasing purity requirements, the global electronic grade ultrapure water polishing mixed bed resin market is expected to maintain medium-to-high growth momentum while continuing to evolve toward higher purity, longer operational life, and localized supply capability.
