Abstracts

According to this study, the global Pollination Service market size will reach US\$ million by 2031.

Pollination Service refers to the process of pollinating crops and plants by using managed or rented pollinators, such as honeybees, to improve crop yields and ensure plant reproduction.

The market for Pollination Services is driven by the agricultural sector's reliance on managed pollinators for crop production. With the decline of natural pollinators due to factors like habitat loss and climate change, the demand for managed pollination services has increased to ensure stable crop yields. The market may experience fluctuations based on agricultural seasons, crop types, and regional beekeeping practices. The importance of pollination services in supporting global food production and food security influences the demand for managed pollinators.
