The global Poly (L-lactide-co-e-caprolactone) (PLCL) market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Poly(lactic acid (PLA) has good biocompatibility and processing properties, but its slow degradation rate, brittle texture, and low mechanical strength limit its application. Polycaprolactone (PCL) has good biocompatibility, biodegradability and drug permeability, and has good toughness, processability and heat induced shape memory properties. However, PCL has low strength and poor hydrophilicity, which limits its application. By introducing CL segments into PLA through copolymerization modification, the crystallinity, biodegradability, and mechanical properties of the product can be adjusted, resulting in good flexibility and elasticity of the material. It can be widely used in fields such as biomaterials, 3D printing, and biodegradable biological products.

United States market for Poly (L-lactide-co-e-caprolactone) (PLCL) is estimated to increase from US\$ million in 2025 to US\$ million by 2032, at a CAGR of % from 2026 through 2032.
