Polyacetal Engineering Plastic is a high-performance engineering thermoplastic known for its excellent mechanical strength, dimensional stability, and low friction properties. It is a crystalline polymer derived from formaldehyde and is commonly used in precision parts that require high stiffness, low wear, and resistance to moisture and chemicals. Available in two main types—homopolymer and copolymer—POM offers advantages such as high fatigue resistance, excellent creep performance, and good machinability. It is widely used in automotive components, gears, bearings, medical devices, electrical parts, and consumer products, where precise tolerances and durability are essential. Its high melting point and ability to maintain mechanical properties over a wide temperature range make it ideal for applications exposed to friction, movement, or varying environmental conditions. Due to its cost-effectiveness and processing versatility, polyacetal has become one of the most important engineering plastics in the global manufacturing industry.

United States market for Polyacetal Engineering Plastic is estimated to increase from US\$ million in 2024 to US\$ million by 2031, at a CAGR of % from 2025 through 2031.
