Polyacrylamide (PAM) is a synthetic polymer that is commonly used as a water purification flocculant. It is highly effective in removing suspended particles, organic matter, and other contaminants from water, making it suitable for various water treatment applications. PAM works by forming large, sticky flocs that trap and settle out impurities in water, allowing them to be easily removed through filtration or sedimentation. It is particularly effective in treating wastewater from industrial processes, municipal sewage treatment plants, and agricultural runoff.

The global Polyacrylamide (PAM) Water Purification Flocculant market size is projected to grow from US\$ 1233.6 million in 2023 to US\$ 1605.7 million in 2030; it is expected to grow at a CAGR of 3.8% from 2024 to 2030.
