The global Polyacrylic Acid Binders market size is predicted to grow from US$ 193 million in 2025 to US$ 561 million in 2032; it is expected to grow at a CAGR of 16.8% from 2026 to 2032.

Polyacrylic acid (PAA) binders are water-based polymer binders used in lithium-ion and solid-state batteries to hold active materials, conductive additives, and solid electrolytes together within the electrode structure. Derived from acrylic acid monomers, PAA provides strong adhesion, high mechanical strength, and excellent chemical stability while enabling safer, solvent-free electrode processing compared to traditional PVDF binders that require toxic NMP solvents. Its carboxyl functional groups improve particle bonding, enhance ion transport pathways, and offer better compatibility with next-generation chemistries such as silicon-rich anodes and sulfide/oxide solid electrolytes. Because PAA supports low-cost, environmentally friendly manufacturing and improves cycle life under high-stress conditions, it is increasingly used as a preferred binder in advanced battery technologies. The price of PAA is $20,000 per ton, with an annual production of approximately 9,000 tons.

The upstream core of polyacrylic acid (PAA) binder lies in the polymerization process using acrylic acid as the primary raw material, requiring precise control over reaction conditions to master key parameters such as molecular structure and viscosity. Downstream, it is closely integrated with lithium battery material systems: on the anode side, it not only serves as a key auxiliary material addressing the volume expansion challenges of silicon-based materials but is also gradually replacing traditional SBR+CMC combinations in graphite systems due to its superior adhesive strength and integrated functionality. On the cathode side, it is primarily applied in lithium iron phosphate systems, where it collaborates with PVDF for edge coating or acts as a

bonding component in carbon-coated aluminum foil to optimize interfacial impedance. Additionally, its water-based nature makes it suitable for ceramic coating applications on separators. Overall, the development of PAA binder is strongly driven by the ongoing advancement of lithium battery technology toward higher energy density and enhanced environmental sustainability.

United States market for Polyacrylic Acid Binders is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
