The global Polyacrylic Resin IV market size is predicted to grow from US\$ 30.03 million in 2025 to US\$ 40.59 million in 2032; it is expected to grow at a CAGR of 4.5% from 2026 to 2032.

Polyacrylate Resin IV is a cationic acrylate copolymer. Typically appearing as a white powder, this material remains stable at room temperature and serves primarily as a pharmaceutical excipient in the fields of medicine and health supplements. It is soluble in acidic gastric environments with a pH below 5 and is predominantly utilized for moisture protection, taste masking, and the application of gastric-soluble film coatings in solid oral dosage forms.

The core upstream raw materials consist of acrylic acid and its esters; as basic chemical commodities, the pricing of these inputs is significantly influenced by fluctuations in crude oil prices. The midstream segment comprises enterprises engaged in the synthesis of polyacrylate resins; the primary challenges at this stage lie in meeting the compliance requirements of various pharmacopoeias (such as the ChP, USP, and EP) and ensuring batch-to-batch consistency in product quality. Downstream, the product flows primarily to pharmaceutical manufacturers (where it is used for gastric-soluble film coatings and isolation layers), health supplement companies, and similar entities.

There is a significant disparity between domestic and international prices for Polyacrylate Resin IV: the average price for imported products stands at approximately \$55 per kilogram, whereas the price for domestically produced products typically ranges between \$10 and \$15 per kilogram. The industry's gross profit margin hovers around 30%.
