The global Polyaluminum Silicate market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Polysilicate aluminum is a new type of inorganic polymer flocculant, which is a composite product of polysilicate and metal salt developed on the basis of polysilicate and traditional aluminum salt flocculants. Polysilicate aluminum is an aluminum-containing polymer compound, usually presenting as a colorless or yellow transparent liquid. It is a composite inorganic cationic polymer flocculant formed by appropriately introducing aluminum ions (such as Al³⁺) on the basis of polysilicate.

Polysilicate aluminum has a wide range of application prospects in the field of water purification. It can be used to treat various industrial wastewater, domestic sewage and drinking water. Under certain specific conditions, such as when the water quality is relatively clean, polysilicate aluminum may show better water purification effect.
