Abstracts

The global Polyether Polyol for Flexible Slabstock Foam market size is predicted to grow from US\$ 20710 million in 2025 to US\$ 30280 million in 2031; it is expected to grow at a CAGR of 6.5% from 2025 to 2031.

Polyether polyols used for flexible foam are generally long-chain, low-functionality polyethers. The polyether polyol functionality in the soft foam formula is generally 2~3, and the average molecular weight is between 2000~6500. Polyether triol is the most widely used in soft foam, generally glycerin (glycerol) is used as the initiator, and there are 1,2-propylene oxide ring-opening polymerization or propylene oxide with two less ethylene oxide. It is obtained by copolymerization, and the molecular weight is generally 3000~7000. Polyether diol can be used as an auxiliary raw material and mixed with polyether triol in the soft foam formula. The soft foam polyether with the largest amount in the early days was polyoxypropylene triol with a molecular weight of about 3000. The terminal hydroxyl groups of such polyethers are mainly secondary hydroxyl groups with low reactivity. Later, PO and EO copolyethers have basically been adopted. The polyether with a molecular weight of 3000~3500, containing a small amount of ethylene oxide chains and primary hydroxyl groups is used for ordinary heat-cured soft foam; the polyether with a molecular weight of 5000~6500 and a high content of primary hydroxyl groups (more than 70% mole fraction), commonly known as 'high Reactive polyether' is mainly used for high-resilience soft foam, and can also be used for semi-rigid foam and other foam products. This kind of polyether has good miscibility with water and isocyanate, suitable reactivity and greatly improved foam process stability. In addition, the foam curing time is shortened, which also reduces the production cost. In recent years, double metal cyanide complex (DMC) catalytic systems have been used at home and abroad to produce low unsaturation, high molecular weight polyether polyols. The high-molecular-weight polyether polyol produced by this new catalytic polymerization

system can even reach a molecular weight of over 10,000, and the molecular weight distribution range is very narrow, which can be used in the production of soft foam and reduce the amount of TDI used.

The flexible slabstock foam market continues to evolve with advancements in foam chemistry and growing sustainability concerns. Manufacturers are increasingly focusing on developing low volatile organic compound (VOC) formulations, renewable-based polyols, and foam recycling technologies to meet environmentally friendly and regulatory standards. Polyether polyols play a vital role in the production of flexible slabstock foam, enabling the creation of high-quality foam products that deliver comfort, durability, and performance in various applications.
