## Abstracts

The global Polyetherimide (PEI) Compounds market size is predicted to grow from US$ 636 million in 2025 to US$ 803 million in 2032; it is expected to grow at a CAGR of 3.4% from 2026 to 2032.

Polyetherimide (PEI) Compounds are high-performance engineering thermoplastic materials in which polyetherimide (PEI) serves as the principal continuous polymer matrix and is industrially melt-compounded with glass fiber, carbon fiber, mineral fillers, PTFE, conductive fillers, wear modifiers, colorants, or other functional additives. These compounds retain the inherent high-temperature resistance, flame resistance, dimensional stability, electrical insulation, and chemical resistance of PEI while providing additional properties such as structural reinforcement, low friction and wear, electrical conductivity, electrostatic dissipation, EMI shielding, improved flow, or other application-specific performance. Major product types include glass fiber-reinforced PEI, carbon fiber-reinforced PEI, mineral and hybrid-filled PEI, conductive/ESD/EMI shielding PEI, wear-resistant and low-friction PEI, and other specialty functional PEI compounds, typically supplied as pellets or granules ready for thermoplastic processing such as injection molding and extrusion. Typical applications include electrical and electronic connectors and insulation components, aerospace components, high-temperature automotive and electric vehicle electrical parts, semiconductor manufacturing equipment, medical and pharmaceutical equipment, and high-temperature industrial components. The market covers PEI compounds that have completed the modification and compounding process and are sold externally as independent commercial materials. It excludes unmodified virgin PEI base resin, PEI monomers and intermediates, PEI sheets, rods, films, 3D printing filaments, continuous-fiber composites, and finished molded or machined PEI components, as well as compounds based on other polymer systems such as PEEK, PPS, PPSU, PES, and PPA.
