The global Polyethersulfone Membrane Virus Filtration market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of %from 2026 to 2032.

Polyethersulfone (PES) membrane virus filtration refers to the use of PES membrane filters for the removal of viruses from a solution. PES membrane filters are highly efficient in viral removal and are commonly used in the biopharmaceutical and vaccine manufacturing industries, where product purity is critical.

PES membrane virus filtration works based on size exclusion and charge effects. The PES membrane filters have small pore sizes ranging from 10 nm to 50 nm, which allows them to retain viruses efficiently. The smaller size of the pores allows for better retention of viruses compared to traditional filters. The PES membrane filters also have a negative charge, which helps to bind and remove positively charged viruses.

During the virus filtration process, the solution containing viruses is passed through the PES membrane filter. The viruses are trapped and retained by the membrane, while the purified solution passes through. The retained viruses can be further analyzed or disposed of safely.

PES membrane virus filtration is a critical step in the manufacturing of biopharmaceuticals and vaccines. The removal of viruses ensures the safety and efficacy of the final product and helps to reduce the risk of contamination.

The prospects for Polyethersulfone (PES) membrane virus filtration are strong due to the increasing demand for high-purity products in the biopharmaceutical and vaccine

manufacturing industries. PES membrane filters have several advantages over traditional virus filtration methods. They have a small pore size, high mechanical strength, and thermal stability, making them efficient in capturing viruses. PES membrane filters also have a wide range of chemical compatibility, making them suitable for use in various applications. The growth of the biopharmaceutical and vaccine manufacturing industries is a key driver of demand for PES membrane virus filters. As the need for high-purity products increases, it is expected that the use of PES membrane filters for virus removal will also increase. Additionally, the increasing demand for personalized medicines and targeted therapies is expected to drive the demand for more efficient virus filtration methods.

Emerging applications of PES membrane virus filtration, such as in the remediation of contaminated water sources, further expand the prospects for this technology. Overall, the prospects for PES membrane virus filtration are positive due to its several advantages and increasing demand for high-purity products in various industries.
