The global Polyethylene Compatibilizers market size is predicted to grow from US\$ 312 million in 2025 to US\$ 426 million in 2032; it is expected to grow at a CAGR of 4.8% from 2026 to 2032.

Polyethylene compatibilizers are functional modified materials made by introducing polar functional groups (such as maleic anhydride, acrylic acid, epoxy groups, etc.) into polyethylene (PE) as a matrix through grafting or copolymerization. They are mainly used to improve the interfacial compatibility between polyethylene and other polar materials or fillers. Because polyethylene itself is a non-polar polymer, its interfacial bonding is weak when directly blended with polar materials such as glass fiber, mineral fillers, nylon (PA), and EVOH. Therefore, grafted compatibilizers such as PE-g-MA are needed to form chemical or physical bonds between the two phases, thereby improving the material's mechanical properties, impact strength, and processing stability.

Polyethylene compatibilizers are widely used in modified plastics, composite materials, cable materials, packaging materials, and automotive parts, and are key functional additives for improving the performance of multiphase materials. Global sales in 2025 were approximately 171.51 thousand tons.

Polyethylene compatibilizers are functional modified materials made by introducing polar functional groups such as maleic anhydride (MAH), acrylic acid, and epoxy groups into polyethylene (PE) matrix through grafting or copolymerization. They are mainly used to improve the interfacial compatibility between polyethylene and polar materials or inorganic fillers. In multiphase blend systems, compatibilizers can enhance interfacial bonding, improve the mechanical properties, impact strength, and processing stability of materials, making them important functional additives for modified plastics and high-performance composite materials. With the accelerating trends of automotive

lightweighting, cable material upgrades, and high-performance packaging materials, the market demand for polyethylene compatibilizers continues to grow.

In recent years, the global modified plastics industry has continued to expand, driving the steady growth of the polyethylene compatibilizer market. Its main application areas include glass fiber reinforced polyethylene, mineral-filled modified polyethylene, PE/PA blends, cable materials, pipes, and packaging composite materials. Among these, the increased demand for lightweight materials in the automotive industry has led to an increase in the application of glass fiber reinforced and high-impact modified materials; the higher performance requirements for cable insulation and sheathing materials in the power and new energy sectors have also driven the growth in demand for high-performance compatibilizers. Meanwhile, the widespread application of biodegradable and bio-based materials is creating new growth opportunities for the compatibilizer market.

From a product structure perspective, maleic anhydride-grafted polyethylene (PE-g-MA) remains the mainstream product, holding a significant market share. Depending on the application system, it can be further subdivided into compatibilizers for filler modification, reactive compatibilizers for engineering plastic blends, and adhesive compatibilizers for multi-layer packaging structures. With the continuous improvement of downstream material performance requirements, the demand for high-end products with high reactivity, low odor, and low volatility is growing significantly. Future product development will focus more on functional customization and formulation matching capabilities.

In terms of the industry chain, the upstream consists of base resins (LDPE, HDPE, LLDPE) and functional monomers (such as maleic anhydride); the midstream comprises graft modification and granulation processing companies; and the downstream consists of modified plastics companies and end-product manufacturing industries. Regionally, Asia is the world's largest production and consumption market, with China showing strong demand in modified plastics and cable materials; Europe and North America have stable demand in high-end engineering plastics and automotive lightweight applications. The competitive landscape of the industry is characterized by 'large-scale enterprises dominating and technology-driven companies focusing on niche markets,' with companies possessing stable grafting technology and formulation development capabilities having a greater competitive advantage.

Looking ahead, the global polyethylene compatibilizer market will be influenced by three main factors: first, the growth in modified plastics production and the downstream trend

towards lightweighting; second, the material upgrading needs of the new energy, power, and automotive industries; and third, environmental protection and low-carbon policies driving material performance optimization. Overall, the market will upgrade from traditional filler modification to high-performance blending systems, and the product structure will gradually shift towards higher value-added directions.
