Polyethylene Glycol (PEG) modification, or PEGylation, is a biochemical technology used to enhance the properties of therapeutic molecules, such as proteins, peptides, and drugs. By attaching PEG chains to these molecules, their solubility, stability, and half-life in the bloodstream are significantly improved, while reducing their immunogenicity and frequency of administration. PEGylation can protect therapeutic agents from enzymatic degradation, reduce renal clearance, and minimize adverse immune responses, thus enhancing the overall efficacy and safety of medical treatments. This technology is widely utilized in the development of biopharmaceuticals, including various cancer therapies, enzyme replacement therapies, and vaccines.
