Polyethylene microspheres are tiny spheres made of polyethylene, usually between 10 microns and 500 microns in diameter. This kind of microsphere can be prepared through a series of processes, including dissolving polyethylene particles in an appropriate solvent, adding cross-linking agents, surfactants and other additives, and performing operations such as emulsification, stirring, drying, and screening. Polyethylene microspheres are highly plastic and their properties can be adjusted by controlling the type of monomer and the conditions of the polymerization reaction.

The global Polyethylene Microspheres market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
