Polylaurolactam, also called Nylon 12, is a thermoplastic polymer with the formula $[-(\text{CH}_2)_{11}\text{C}(\text{O})\text{NH}]_n$. It is made from either ω -aminolauric acid or laurolactam, each having 12 carbon atoms. This type of polyamide has excellent impact strength and much lower moisture absorption, melting point and density than the standard Nylon 6 and Nylon 6,6. It is also less sensitive to stress cracking. On the downside, it has lower flexural and tensile strength as well as lower heat deflection and glass transition temperature than standard Nylon.
