Polymer banknote substrates are specialized materials used as the foundation or base layer for manufacturing polymer banknotes, which are currency notes made from a synthetic polymer material rather than traditional paper. These substrates are typically composed of a blend of polymer resins, additives, and security features to ensure durability, security, and longevity of the banknotes. Polymer substrates offer several advantages over paper, including resistance to tearing, water, and dirt, as well as increased longevity in circulation. Additionally, polymer banknote substrates can incorporate advanced security features such as transparent windows, holograms, and color-shifting inks to deter counterfeiting attempts.

The global Polymer Banknote Substrates market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
