Syntactic foam is a class of composite materials synthesized by dispersing hollow or non-hollow microspheres into a polymeric, metal, or ceramic matrix. Syntactic foams are extremely lightweight and possess unique properties of high strength at low density. As a result, they are witnessing growing adoption in subsea insulation and buoyancy applications. Owing to their superior ability to withstand extremely high hydrostatic pressure and long-term exposure to seawater, they are widely used in deepwater pipe insulations and as buoyancy modules for various marine components used in offshore exploration and production activities. Some of the key resin systems used in the production of syntactic foams include phenol, epoxy, cyanate ester, siloxane, polybenzoxazine, and bismaleimide, among others. The hybrid matrix type segment is expected to grow at the fastest pace during the review period due to its superior mechanical strength and progressive adoption in aerospace & defense applications.
