A Polymer Underwater Pelletizing System is an advanced processing technology used to convert molten polymer into small, uniform pellets through an underwater granulation process. In this system, the polymer is extruded through a die and cut into strands, which are then immediately quenched and solidified by being submerged in a water bath. The water rapidly cools the polymer strands, causing them to solidify into pellets. These pellets are then separated from the water, dried, and collected. The underwater pelletizing system is renowned for its ability to produce high-quality pellets with consistent size and shape, which are crucial for downstream processing and applications. It is particularly advantageous for processing high-performance polymers, as the rapid cooling minimizes thermal degradation and maintains the material's properties. This system is widely used in various industries, including plastics manufacturing, chemical processing, and recycling, due to its efficiency, high throughput, and ability to handle a wide range of polymer types.

The global Polymer Underwater Pelletizing System market size is projected to grow from US\$ 753 million in 2024 to US\$ 944 million in 2030; it is expected to grow at a CAGR of 3.8% from 2024 to 2030.
