A stent is a medical device which is inserted into the internal duct of the body for expanding the blood vessels and preventing the vessels from blockage. Bioabsorbable stents, also known as bioresorbable stents or naturally-dissolving stents, are made up of materials that get absorbed in the body and act by expanding the vessels or internal duct for clearing the blockage caused due to the deposition of plaque. These devices are designed in such a way that after eluting the drug, the stents gets dissolved within the body at certain interval of time. Research is still conducted on polymeric stent materials for the development of the novel bioabsorbable stents, which possess low risk for restenosis and late-stent thrombosis.

The global Polymeric Bioabsorbable Stents market size is projected to grow from US\$ 123 million in 2024 to US\$ 209 million in 2030; it is expected to grow at a CAGR of 9.2% from 2024 to 2030.
