The global Polymerization Inhibitor 702 market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Inhibitor 702 is a new and efficient free radical type polymerization inhibitor that is widely used and has high polymerization inhibition efficiency. It has good polymerization inhibition effect in both aerobic and anaerobic environments, and has a low melting point. Used to prevent self polymerization of polyolefin monomers during production, separation, refining, storage, or transportation, and to control and regulate the degree of polymerization of polyolefins and their derivatives in organic synthesis reactions. The product has good polymerization inhibition effects on acrylate, methacrylate, acrylic acid, acrylonitrile, styrene, and butadiene. Its polymerization inhibition performance is superior to inhibitors such as phenols, aromatic amines, ethers, quinones, and nitro compounds.
