The global Polymers in Medical Devices market size is predicted to grow from US\$ 5165 million in 2025 to US\$ 5877 million in 2031; it is expected to grow at a CAGR of 2.2% from 2025 to 2031.

A polymer is a large molecule, or macromolecule, composed of many repeated subunits. Because of their broad range of properties, both synthetic and natural polymers play an essential and ubiquitous role in everyday life. Polymers range from familiar synthetic plastics such as polystyrene to natural biopolymers such as DNA and proteins that are fundamental to biological structure and function. Polymers, both natural and synthetic, are created via polymerization of many small molecules, known as monomers. Their consequently large molecular mass relative to small molecule compounds produces unique physical properties, including toughness, viscoelasticity, and a tendency to form glasses and semi crystalline structures rather than crystals.

BASF, Covestro, DuPont, DSM and Celanese are the leading producers of polymers in medical devices, with the top five accounting for about 35% of the market.

North America is the main production region, accounting for about 30%, followed by Europe and China, accounting for about 25% and 20% respectively.
