Polyolefin Microporous Membrane is a microporous film made of polyolefin materials such as polyethylene (PE) and polypropylene (PP). Its pore size is usually in the nanometer to micrometer scale. It has excellent mechanical processability, electrochemical stability, air permeability and thermal stability. It forms a penetrating slit-type or internally connected elliptical microporous structure through dry or wet processes. It is used as a diaphragm material in lithium-ion batteries, sodium-ion batteries and other fields to achieve positive and negative electrode isolation and ion conduction functions. At the same time, it has become the most widely used microporous membrane material with its advantages of low cost, strong chemical stability and good mechanical properties.
