Polyphenol oxidase (PPO), also commonly known as tyrosinase, is an enzyme that plays a crucial role in the oxidation of phenolic compounds. This process often leads to the browning reaction seen in fruits and vegetables when they are cut or bruised, as well as in the formation of melanin in animals. PPO catalyzes the enzymatic oxidation of phenols to o-quinones, which can then undergo further reactions to form brown pigments through polymerization. PPO is not only found in plants but also in animals, fungi, and bacteria, where it serves various functions, including pigment production, wound healing, and defense mechanisms.
