Polypropylene BCF yarn, the full name is polypropylene bulked continuous filament, and its English abbreviation is BCF (Bulked Continuous Filament). It is a continuous filament made by a polypropylene polymer compound through a melt spinning method. During the spinning process, through specific process means, such as hot air puffing, mechanical stretching, etc., the polypropylene yarn is made fluffy and soft in appearance and feel, thus giving it a unique bulking effect and network structure. After special process treatment, the polypropylene BCF yarn has a significant bulking effect, the yarn is fluffy and soft, and the feel is similar to wool or cotton fiber. Its internal fiber network structure is uniform, which is conducive to enhancing the cohesion between fibers and improving the overall performance of the product. It can be dyed and processed according to customer needs, with bright colors and rich and diverse colors to meet the needs of different occasions and uses.

The global Polypropylene BCF Yarn market size is projected to grow from US\$ 35.7 million in 2024 to US\$ 45.9 million in 2030; it is expected to grow at a CAGR of 4.3% from 2024 to 2030.
