The clarifying agent for plastics is a material that is used in the manufacturing of plastics and items connected to the production of plastics. This substance helps to raise the clarity of PP by lowering the size of the spherulites in the plastic. The haze of the component was spoken for by the smaller spherulites, which allowed more light to pass through the polymer. Clarifiers, in contrast to nucleating agents, are transparent, which helps to minimize haze values and also makes them easier to see.
