The global Polystyrene Fluorescent Microspheres market size is predicted to grow from US\$ million in 2025 to US\$ million in 2032; it is expected to grow at a CAGR of % from 2026 to 2032.

Polystyrene fluorescent microspheres are small, spherical particles made of polystyrene, a type of plastic, that are coated with fluorescent dyes. They are used in a variety of applications, including microscopy, flow cytometry, diagnostics, and as calibration standards. The fluorescent dyes are added to the polystyrene microspheres during the manufacturing process, and are chosen to emit a specific wavelength of light when excited by a light source. This makes them useful in applications where they can be used as markers or indicators, such as in biological imaging or environmental monitoring.
