Abstracts

The global Polyurea Anti-corrosive Coating market size is predicted to grow from US\$ 190 million in 2025 to US\$ 399 million in 2032; it is expected to grow at a CAGR of 11.2% from 2026 to 2032.

In 2025, global sales of Polyurea Anti-corrosive Coatings reached 118,000 tons, with an average selling price of US\$1,650 per ton. Polyurea Anti-corrosive Coatings are high-performance, elastic anti-corrosion layers formed by the rapid curing of isocyanates and polyether/polyester prepolymers containing active amino groups through a spraying reaction. They feature ultra-fast curing, excellent abrasion resistance, chemical corrosion resistance, weather resistance, and extremely strong adhesion, and are widely used in bridge and highway protective layers, tank linings, port terminals, waterproofing projects, and marine facilities. Global total production capacity is approximately 135,000 tons per year, with an overall gross profit margin of approximately 47%. Upstream raw materials mainly include MDI/TDI isocyanates, polyether/polyester polyols, catalysts, additives, and pigments and fillers, with isocyanates and polyols accounting for the largest proportion of material consumption. Downstream suppliers primarily include building corrosion protection engineering companies, oil and gas storage and transportation facility operators, marine engineering contractors, and infrastructure construction units. With the aging and renovation of global infrastructure, marine development, and the improvement of environmental standards, the demand for high-performance anti-corrosion systems continues to grow. This is driving the development of polyurea anti-corrosion coating technology towards lower temperature curing, environmentally friendly solvent-free coatings, and integration with intelligent spraying equipment. Future prospects lie in the research and development of automated spraying robots, online thickness control, and solvent-free water-based systems. Business opportunities mainly come from green building, offshore

wind power foundations, extended anti-corrosion cycles, and optimized maintenance costs.

The polyurea anti-corrosion coating market is showing a steady growth trend, driven by the expansion of global infrastructure construction, accelerated marine engineering development, and increasingly stringent anti-corrosion performance requirements. Polyurea coatings, with their fast curing, strong weather resistance, and excellent resistance to chemical corrosion and mechanical impact, are gradually becoming an important material choice for high-end applications such as bridges, highway protection, tank linings, pipeline corrosion protection, port terminals, and wind power infrastructure. With increasingly stringent global environmental policies and higher construction safety standards, the demand for solvent-free, low-volatile, environmentally friendly polyurea systems is increasing, prompting continuous upgrades in coating formulations and construction equipment technology. Furthermore, the trend of combining polyurea anti-corrosion construction technology with automated equipment is becoming increasingly apparent. The use of spraying robots and online thickness detection systems improves construction efficiency and quality stability, reduces labor costs and rework risks, thereby enhancing the overall economics of downstream projects.

In terms of regional market structure, rapid growth in infrastructure investment in emerging economies has created significant market opportunities for polyurea anti-corrosion coatings, while mature markets' focus on extended maintenance cycles and optimized lifecycle costs is driving the replacement of traditional anti-corrosion systems with high-performance products.

In summary, the polyurea anti-corrosion coating market will not only benefit from the continued release of traditional anti-corrosion demand, but will also gain new growth points and competitive advantages in green and environmentally friendly materials, construction automation, and high-performance system innovation.
