Narrowly speaking, polyurethane resin refers to compounds with amino ester bonds in their molecules, but more broadly, they are all resins derived from isocyanate compounds. In addition to amino ester bonds, they also include urea, biological urea, isocyanate, and carbodiimide bonds. Since Otto Bayer et al. of Germany found the practical application of polyurethane in 1937, they have been widely used in gel, elastomer, and even hard plastic, insulation and buffer foam. This widespread application is due to the fact that polyurethane resin can be freely designed by selecting raw materials, which is one of the most important characteristics of polyurethane resin.

The global Polyurethane Resin for Leather market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
