The global Polyurethane Rubber Vulcanizing Agent market size is predicted to grow from US\$ 452 million in 2025 to US\$ 602 million in 2032; it is expected to grow at a CAGR of 4.3% from 2026 to 2032.

Polyurethane Rubber Vulcanizing Agents?also referred to as chain extenders or crosslinking agents for polyurethane elastomers?are functional additives utilized to facilitate the subsequent reaction and molding of isocyanate prepolymers, polyurethane systems, or polyurea systems. Typical products include MOCA/MBOCA, DETDA, DMTDA, MCDEA, and HQEE; these agents primarily determine the polyurethane rubber's hardness, resilience, abrasion resistance, heat resistance, compression set, processing window, and environmental compatibility.

The upstream segment of the industry chain primarily comprises aromatic amines, chlorinated aromatics, intermediates such as diethyltoluenediamine and dimethylthiotoluenediamine, hydroquinone, ethylene oxide, polyetheramines, and isocyanates. The midstream segment focuses on the R&D and large-scale production of curing agents, where the core barriers to entry lie in the control of synthesis purity, the modification of crystalline morphology, and the environmentally friendly separation of isomers. The downstream segment directly interfaces with the processing and manufacturing industries for various rubber compounds, such as millable polyurethane rubber and cast polyurethane elastomers.

In 2025, global sales volume for polyurethane rubber curing agents is projected to reach approximately 60,000 tons, with an average price ranging from \$7,000 to \$8,500 per ton; leading enterprises in the sector are expected to maintain gross margins between 22% and 38%.

Demand within the polyurethane rubber vulcanizing agent industry is primarily driven by the steady application of polyurethane elastomers across sectors such as industrial wear-resistant components, mining and metallurgy, transportation, construction engineering, and energy and chemicals. As the demand for equipment that is lightweight, wear-resistant, impact-resistant, and low-maintenance continues to rise, polyurethane elastomers are increasingly displacing traditional rubber, metals, and certain engineering plastics; this trend, in turn, is fueling growth in the demand for curing agents, chain extenders, and crosslinking agents. The direction of product upgrading within the industry is clearly defined: on one hand, traditional MOCA/MBOCA-based products continue to retain a share of existing demand?bolstered by their cost-effectiveness and established formulation foundations?while on the other hand, systems characterized by low toxicity, liquid form, low-temperature processability, high heat resistance, low compression set, and superior wear resistance are better aligned with the developmental trajectories of downstream applications such as high-performance elastomers, sprayed polyurea, industrial seals, and specialty coatings.
