Market players need to invest in research and development, forge strategic partnerships, and align their offerings with evolving consumer preferences to capitalize on the immense opportunities presented by the Polyurethane Thermoplastic Elastomer market.

Polyurethane thermoplastic elastomer is a (AB)_n type block linear polymer, where A is a high molecular weight (1000~6000) polyester or polyether, B is a glycol containing 2~12 linear carbon atoms, AB_n The chemical structure between the segments is diisocyanate. This elastomer is cross-linked through intermolecular hydrogen bonds or light cross-linking between macromolecular chains. As the temperature increases or decreases, these two cross-linked structures are reversible. In the molten state or solution state, the intermolecular forces weaken, but after cooling or the solvent evaporates, strong intermolecular forces connect them together to restore the original solid properties.
