Abstracts

The global Polyvinyl Siloxane market size is predicted to grow from US$ 707 million in 2025 to US$ 1015 million in 2032; it is expected to grow at a CAGR of 5.4% from 2026 to 2032.

In 2024, global production of Polyvinyl Siloxane reached approximately 325 kilotons, with an average global market price of around USD 2,100 per ton. Polyvinyl Siloxane is a type of addition-curing silicone elastomer composed of vinyl-terminated polydimethylsiloxane chains and siloxane cross-linkers, commonly used as an impression material in dentistry and other precision molding applications. It is known for its excellent dimensional stability, high tear resistance, rapid setting time, and low shrinkage, allowing it to accurately capture fine surface details. The material remains flexible after curing, is biocompatible, and exhibits hydrophobic properties, which help minimize distortion from moisture during impression-taking.

Polyvinyl Siloxane is made from vinyl-terminated silicone polymers, platinum catalysts, crosslinkers, fillers, and additives, then compounded, packaged, and supplied mainly for dental impressions. Global annual production capacity is about 400 kilotons, and its high precision and regulatory requirements allow gross profit margins of roughly 35–50%.
