Porous ceramic atomizing core is a special ceramic material, mainly used in the atomization equipment of electronic cigarettes. Compared with the traditional atomization method, porous ceramics contain abundant micropores, and the porosity is controlled by a special sintering process, so the aerosol particle size of the mist can be adjusted arbitrarily. The ceramic has the characteristics of low thermal conductivity, low density, and low specific heat capacity. Due to its own material properties, the temperature field of the liquid is relatively uniform during the atomization process, and the atomization is more complete per unit time, which brings a better experience to users with higher atomization efficiency.

The global Porous Ceramic Atomizing Core market size is projected to grow from US\$ million in 2024 to US\$ million in 2030; it is expected to grow at a CAGR of % from 2024 to 2030.
