In 2024, the global production of porous polymer filtration membranes is 51.37 million square meters, with an average selling price of US$35 per square meter.

Porous polymer filter membranes are a type of filtration medium made from polymer materials and possessing micron- or nanometer-scale pore structures. They are widely used for separating and purifying particles, microorganisms, and molecular-level impurities in liquids or gases. Their core principle is to achieve selective permeation or retention of substances of varying particle sizes and molecular weights through the sieving effect of the membrane surface or internal pores. Common materials include polyvinylidene fluoride (PVDF), polyethersulfone (PES), polytetrafluoroethylene (PTFE), nylon, and polypropylene (PP). The membrane structure can be symmetrical or asymmetrical, with a uniform pore size distribution. They offer high flux, low adsorption, and strong chemical stability. These membranes are widely used in biopharmaceuticals, food and beverages, electronics and semiconductors, water treatment, and environmental monitoring, and are a core material in modern separation technologies.

United States market for Porous Polymer Filter Membrane is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.

China market for Porous Polymer Filter Membrane is estimated to increase from US$ million in 2025 to US$ million by 2032, at a CAGR of % from 2026 through 2032.
